3.	Key Known Issues for This Release .....	2

## 1. Key Enhancements

- Improved German translation in the InstantAtlas Desktop Software

### 1.1. Templates

- Single Map, Double Map, Double Map Time Series and Area Profile templates are now able to publish reports in German

### 1.2. Designer

- 'Select' list in Designer allows selecting components that are positioned behind others components

## 2. Key Bug Fixes

### 2.1. Designer

- Saving a version 5 config file in version 6.1.1 Designer no longer breaks the config file
- Changes in text fields will be applied when clicking somewhere else in the Designer without the need to press 'Enter'

### 2.1. Templates

- Numbers between 0 and 1 now have a 0 before the decimal point
- When time series has gaps between dates a line is now drawn through the gap
- Applied filter remains applied when changing the geography in a multiple geography report (as long as the filter also exists in the other geography)
- Colours of comparison geographies can now be customised in the style sheet (new style property called ".comparisonAreas")
- "No Data" features and such with categorical values in a numeric indicator will no longer reserve space in the bar chart
- All fonts can now be applied to text components
- Scrollbar on colour palettes box in the legend menu does not jump to the top anymore when selecting a colour palette from the second row
- 'Restore down' Button no longer stays active if the option 'Reset Layout' from the context menu is clicked when a component is maximised

#### 2.1.1 Double Map Template

- The correlation line in the scatter plot is now always visible even when filters are applied
- Deleted components in the config file can now be re-inserted after saving and re-opening the config file in the Designer

#### 2.1.2 Area Profile Template

- The script 'toggleSpineChart' now toggles the spine chart on and off

### 3. Key Known Issues for This Release

- The templates can only be published in English and German
- Reports do not work with Flash Player 9,0,16
- The Radar Chart and Funnel Plot templates are not included
- Contextual geography features will show the code rather than the name when hovered
- It is not possible to add metadata boxes and comparison tables into the English versions of these configurations:
  - Single Map template – Large Map
  - Double Map template – Small Scatter Plot
  - Double Map Time Series – Vertical Layout
